

NEXVIEW Systems is now offering an On-line backup service

What is an On-line Backup

NEXVIEW Systems is offering a new service which enables you to Back up and restore critical computer data over the Internet, LAN, or any TCP/IP network. It's the state of the art in online backup technology.

As we all know, company data needs to be backed up so that if it is corrupted or accidentally deleted it is easily restored from the previous day. Not only will this help company's information be kept safe but in some cases it is a legal requirement that companies have a backup disaster recovery solution put in place.

How it works

The remote backup software is installed on your server and configured in such a way that it is scheduled to run at night time. The software simply connects to our server at NEXVIEW Systems and sends a copy of all the files our server over the internet. Once it has completed our server will have a complete copy of your data and a log file is generated by the program indicating which files have been sent, which can be later viewed for your information.

Each day as the program is scheduled to run, the program will connect to our server and compare each file to the current data on your server to see if it had been modified during the day. Each file that has been modified is added to a list. When all files have been checked, only the files that are in that list are sent to our server.

This process of connecting to a server and comparing the files which have been changed is referred to as "Synchronisation".

Benefits of On-line Backups

The biggest benefit of using a remote backup solution for keeping data backed up is the fact that it is offsite. If you are using a secondary storage solution such as a USB drive or tape backup which is located in the same building as the actual data, you still run the risk of losing both the backup and original data in case of a fire or theft. Having data offsite stored securely in a safe location makes it a perfect solution.

How many times have you forgotten to run a backup or simply didn't have the time? Remote backups are scheduled to run while you are fast asleep in bed. Once setup and scheduled, there is no user interaction needed, they are fully automated, which means you have more time to do other things.

Restoring

If you find you need a file restored for what ever reason, a simple phone call to our office along with the name of the file is needed and we will send the file back to your server within minutes.

Costs

The price of having this remote backup solution installed for your company is dependant of the amount of data you transfer per month. Listed below are data prices per GB charged on a monthly basis.

Data Size	Price
Under 3GB	\$45.00
3 → 5GB	\$65.00
5 → 10 GB	\$105.00
10 → 20GB	\$150.00
20 → 50 GB	\$190.00
